EASY and Plasmon Set a New Standard for Email Archiving Compliance

The benefits to a well-managed email archive strategy are clear. Not only does it provide better access and improved resource management, but it allows organisations to address their growing obligation to comply with industry regulations for the retention and disposition of business information.

Organisations must have their email resources easily accessible, but equally important is the need for emails to be destroyed when they reach end-of-life. This emerging requirement for record destruction is being driven by the obligation to comply with external regulations such as GBPDU and GoBS, and by internal corporate risk management. In the past, it may have been acceptable to delete the reference or encryption key to an archived email, but for many organisations this is no longer adequate. The physical destruction of records is essential to ensure they can no longer be accessed.

Plasmon and EASY SOFTWARE, leaders in the document management and archiving market, have teamed up to address the increasing strict demands being placed on record archives. The combination of EASY Notes or EASY xBASE software and Plasmon's new Compliant Write Once UDO media provides effective email management for Lotus Notes and Microsoft Exchange with an archival storage technology that delivers longevity, authenticity and controlled data destruction.

Designed specifically for long-term data archiving, 30GB UDO has been chosen by thousands of organisations worldwide because it satisfies both technical and legal requirements. In direct response to evolving archive requirements,

Plasmon has released a new Compliant Write Once UDO media provides "WORM" authenticity, which is essential to establishing legal admissibility but with one very important difference. Through the use of special "shred" command controlled by the EASY software, individual emails can be physically destroyed on the UDO media when they reach the end of their retention period.

The shredding of records on UDO is a fully verified process and unlike the erase pass on magnetic disks, the shred operation on Phase Change optical media leaves no residual trace of previously written files. UDO Compliant Write Once media also offers a major advantage over magnetic tape archives since tape technology provides no means of destroying individual records without totally rewriting the media. Shredding data on Compliant Write Once UDO media enables record level retention management with the highest possible standard for physical data destruction.

With its rules based email archiving, EASY Notes and EASY xBASE software provide effective organisation and administration of Lotus Notes Domino and Microsoft Exchange environments. The EASY Server architecture runs in the background using pre-defined triggers to fully automate the archive process, providing the Administrator with total control of folder and document management. Overloaded email servers, restrictions on mailbox size, long backup/restoration time frames and costly administration are eliminated. EASY's full text search facilities provide exceptional search performance on the individual user's email or attachments. Plus, using EASY Notes or EASY xBASE

also allows users to access any other existing corporate EASY archives whose data stem from ERP systems or contain customer information that was archived via EASY's other server modules or scan modules.

The combination of EASY SOFTWARE and Plasmon UDO storage provides an unbeatable solution for secure email archive management for virtually any size organisation. Solutions begin with a single UDO Desktop Drive for small office environments and grow to enterprise archive requirements using high capacity G-Series UDO libraries.
